Age of Relief Persons Employed on WPA Projects in June 1936

Age is a factor that has come to demand recognition in connection with the employability of workers. This has made age information necessary to the consideration of such basic social problems as dependency, unemployment, and reemployment opportunities for unemployed workers. In order to provide some information of this kind, a tabulation was made of the ages of WPA project workers from relief rolls who were employed in June 1936.

The study indicates that almost 38 percent of the 2,000,000 workers from relief rolls employed on WPA projects in June 1936 were 45 years of age or older. Nearly 48 percent were between 25 and 44 and the remaining 14 percent were under 25 years of age. From these over-all percentages, age distributions of men and of women workers, and of workers assigned in various wage classes and in urban and rural areas of the country show material differences. 1/

Age of Men and Women Employed

In general the women workers were younger than the men employed on WPA projects, as indicated by the fact that their median age was about 38 years as compared with 40 for men employed. More than 68 percent of the women as compared with 61 percent of the men were under 45 years of age. The difference in the percentages of men and of women in the various age groupings under 45 was particularly marked in the case of workers between 16 and 19 years old. A greater concentration of women than of men in the age groups under 45 years is also characteristic of the total working population.

Differences in the age distributions of men and women workers may be observed in the proportions of each in the various age groups. The percentage of the total which men represent increases, in general, as age increases. Men comprise 73 percent of the workers under 20 and almost 89 percent of the workers 65 years of age or older, as compared with the average of 82 percent for workers of all ages.

Wage Class Variations

Persons employed on WPA projects at security wage rates are assigned in any one of the four different wage classes according to which monthly wage rates vary - the unskilled, intermediate, skilled, and professional and technical. Differences between the age distributions of workers assigned in these wage classes result from a number of interrelated factors, among which are the extent of experience or training required for the occupations included in each wage class, variations among the localities in methods of assigning workers

to wage classes, and other administrative policies.

Men employed as unskilled workers were more equally distributed among the various age groups than men in any other class, and were relatively more numerous in the youngest and oldest age groups (under 25, and 55 and over) than workers in other wage classes. The largest proportion (29 percent) of the men in the intermediate (semiskilled) class were between 25 and 34 years old and 13 percent were under 25, in contrast to the skilled men of whom relatively the greatest number (30 percent of the total) were between 35 and 44, and less than 7 percent were under 25. In the case of men assigned to professional and technical work, more than 10 percent were under 25 and almost equal proportions (over 28 percent) were in each of the two next higher 10-year age groups.

Women workers were much more concentrated in the younger age groups than were the men, those under 25 years of age representing over 20 percent of the total in all wage classes except the unskilled. Of the unskilled women only 14 percent were under 25 and the proportion who were 45 or older was larger than for any other wage class. Women of 45 or older were relatively least numerous among those assigned to professional and technical work. On the other hand, more than half the professional and technical women were less than 35 years old and 31 percent were concentrated in the 25- to 34-year age group.

The differences between the median ages of men and women workers in each wage class tend to increase with the rising requirements of skill. Unskilled women were only a year younger than unskilled men, but women in the skilled class were approximately six years younger than the men assigned in the same wage class. Also, the median age of women workers decreased consistently with the increase in skill required, unskilled women being almost 40 and women in the professional and technical class under 35 years old. This tendency was not evident in the case of male workers.

Variation with Degree of Urbanization

The age characteristics of WPA workers from relief rolls vary somewhat with the degree of urbanization of the localities in which they are employed. This is indicated in the tabulation on page ix showing the age distributions of men and women workers in each of the five population groups for which different wage rates are specified in the established earnings schedule. The most highly urban areas (Urbanization Group A, comprising counties containing cities of over 100,000 population in 1930) had the smallest proportion (about a third) of all male workers in the age groups under 35 years. The proportions of total men who were in these younger age groups increase with some regularity as the concentration of population decreases; the least urban areas (Urbanization Group E, representing counties in which the largest municipality numbered less than 5,000) showed about 43 percent of the men employed as under 35 years of age. The latter areas also had relatively the smallest number of men 45 years of age or older working on WPA projects.

Differences in the age distributions of women workers from one population group to another were less marked. Such tendencies as can be discerned are roughly the reverse of those noted in the case of men. This was particularly evident in the proportions of workers 45 years old and over. These older women were relatively most numerous in the rural areas (Urbanization Group E) and least numerous in the more thickly populated counties (Urbanization Groups A and B).

Variation Among the States

The varying importance of the above-mentioned and other closely interrelated factors, such as types of industrial unemployment and local economic conditions, produces marked variation from State to State in the age distributions of WPA workers. It should be noted, in addition, that variations among the States also reflect differences in local relief policies regarding the certification of persons (particularly women) in certain age groups as eligible for Works Program employment.

Some uniformity among the States is observed in the proportion of total workers who were from 25 to 44 years of age. In only three States were more than 55 percent and in only two were less than 40 percent of the workers within this age range as compared with about 48 percent for the country as a whole.

For the most part the States showing the widest variation in the proportions of workers in the younger and older groups were those in which total WPA employment was small. Nevada, for instance, employed relatively the smallest number of workers under 25 years old - only 7 percent - and the proportion of its WPA workers who were 65 or older was more than four times as great as that for the entire country.

Persons from relief rolls employed on WPA work camp projects, who totaled more than 21,000 in June 1936, were as a rule considerably older than the persons employed on regular WPA projects. Almost 51 percent of them were 45 years of age or older, as compared with 38 percent of the regular project workers.

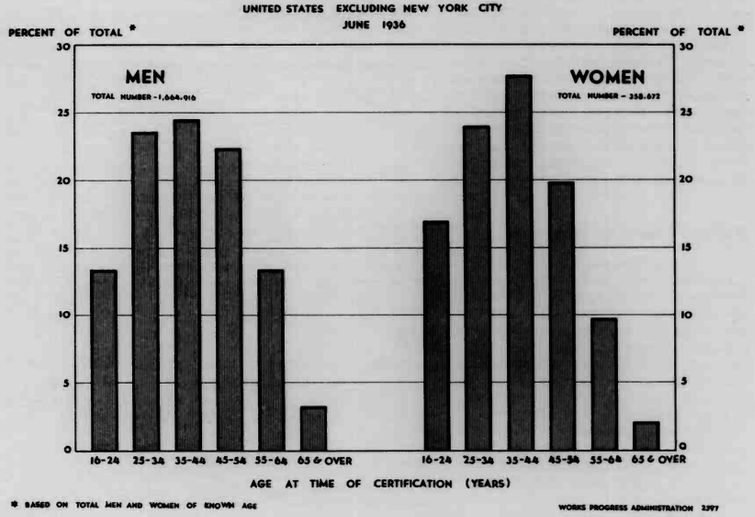
A/ The security wage schedule provided by Executive Order 7046 specified different wage rates for five groups of counties of varying degrees of urbanization; these groups, referred to here as A, B, C, D, and E, respectively, cover counties in which the 1930 population of the largest municipality was: Over 100,000 (A), 50,000 to 100,000 (B), 25,000 to 50,000 (C), 5,000 to 25,000 (D), under 5,000 (E).

Description of the Data

The tabulations dealing with the age of WPA workers cover the entire United States with the exception of New York City. All persons certified as in need of relief whose names appeared on WPA project pay rolls ending in June 1936 were included except administrative personnel, youths employed on WPA projects at NYA rates and hours, and persons working on NYA projects. Persons employed at WPA work camps, owner-operators of equipment, and nonsecurity

AGE DISTRIBUTIONS OF MEN AND OF WOMEN FROM RELIEF ROLLS EMPLOYED ON WPA PROJECTS



wage workers were covered as well as persons employed at regular security wage rates.

The data were tabulated according to the degree of urbanization of the localities in which the workers were employed as well as according to age and assigned wage class. The five degrees of urbanization used are those for which different wage rates were specified in the monthly earnings schedule established by Executive Order No. 7046. These groups distinguish between counties in which the 1930 population of the largest municipality was:

Over 100,000	- Urbanization Group A
50,000 - 100,000	- Urbanization Group B
25,000 - 50,000	- Urbanization Group C
5,000 - 25,000	- Urbanization Group D
Under 5,000	- Urbanization Group E

The tabulation according to this grouping was based on wage rates in effect in June 1936. These rates in some instances represented modifications of the rates provided by the original earnings schedule - modifications which served, in effect, to transfer counties from one urbanization grouping to another.

In most instances the age of the worker was taken from documents used to certify relief recipients as eligible for Works Program employment. Certification occurred largely between May and November 1935, inclusive. In some cases, however, age was taken as of a time prior to 1935, and in other, though fewer, cases, it relates to the time of actual assignment to work. Since no adjustment has been made in these data, they represent, for the most part, the age of workers at the time of the certification of their eligibility for employment rather than their age in June 1936.

Age data for about 14 percent of the workers were not available. Percentage distributions were computed on the basis of the distributions of workers of known ages.

There is no reason to believe that these distributions are materially different from the age distributions for all workers.

Comparisons of the age distributions of WPA workers with census or similar data require that certain qualifications should be kept in mind. At least three major qualifications are involved. In the first place, a period of about five years had elapsed since the 1930 enumeration was made. During this time the age distributions of gainful workers may have changed substantially, particularly in view of the fact that the period was one of marked economic depression. Secondly, the census data on gainful workers exclude persons without previous work experience, many of whom are employed on WPA projects and therefore included in the age distributions of WPA workers. Finally, census data include all members of families who normally are gainfully employed, whereas, with few exceptions (representing about 5 percent of the total), WPA jobs were given only to heads of families.

Fewer qualifications affect a comparison of age distributions of WPA workers from relief rolls with employable heads of families on relief in March 1935, as shown by the labor inventory of that date. However, the changes which occurred in the relief population between March 1935 and June 1936 are probably sufficiently important to qualify any direct comparison between the two sets of data. The recovery characteristic of this period affected unequally the workers in various industries, occupations, and sections of the country; this is but one factor making for change between the two dates.

Tabulations Presented

Three groups of tables compose this bulletin - national summaries, State summaries, and a summary for work camp personnel. In the first group are three tables showing total numbers of persons, of men and of women workers, by States and by age groups, and another table showing the number of men and women by urbanization groups and wage classes as well as by age groups. Four additional tables give the percentage distributions of these data. The second group of tables includes a tabulation for each State showing number of men and women workers classified by age groups, by wage classes, and by urbanization groups. Workers in WPA work camps are the subject of the third set of tables which includes tabulations giving the age distributions of these workers by wage classes and by States.
